CryptoWorks21

Agenda

- Multivariate (quadratic) Public Key Cryptosystems (MPKC)
 - lacktriangle Mathematical Problems: the \mathcal{MQ} and \mathcal{IP} problems
 - lacktriangleright Building cryptography from the \mathcal{IP} problem
 - ► The (yet-successful) UOV and Rainbow signature schemes

Motivations of MPKC

• Use systems of (non-linear) equations over finite fields.

Motivations of MPKC

- Use systems of (non-linear) equations over finite fields.
- Modern math:

In contrast, the security of RSA-type cryptosystems relies on the complexity of integer factorization and is based on results in number theory developed in the 17th and 18th centuries. Elliptic curve cryptosystems employ the use of mathematics from the 19th century. This quote is actually from Whitfield Diffie at the RSA Europe conference in Paris in 2002. At least Algebraic Geometry, the mathematics that MPKCs use, is developed in the 20th century.

-Ding, J. and Yang, B. [D.J., Buchmann, and Dahmen 2009]

Avoid putting all eggs in one basket.

Why quadratic?

Given a system of cubic (or higher degree) equations

Why quadratic?

Given a system of cubic (or higher degree) equations

$$x_1x_2x_3 + 2x_1x_3 - 3x_2^2x_3 - 7 = 0$$

$$...$$

$$-x_1x_2 + x_1x_3 + 6x_3^3 - 7 = 0$$

One can always perform **degree reduction** or **linearization** by introducing new variables $x_4 = x_2x_3$ and $x_5 = x_3^2$

Why quadratic?

Given a system of cubic (or higher degree) equations

$$x_1x_2x_3 + 2x_1x_3 - 3x_2^2x_3 - 7 = 0$$

$$...$$

$$-x_1x_2 + x_1x_3 + 6x_3^3 - 7 = 0$$

One can always perform **degree reduction** or **linearization** by introducing new variables $x_4 = x_2x_3$ and $x_5 = x_3^2$

Why quadratic?

Given a system of cubic (or higher degree) equations

$$x_1x_2x_3 + 2x_1x_3 - 3x_2^2x_3 - 7 = 0$$

$$...$$

$$-x_1x_2 + x_1x_3 + 6x_3^3 - 7 = 0$$

One can always perform **degree reduction** or **linearization** by introducing new variables $x_4 = x_2x_3$ and $x_5 = x_3^2$

• Solve the quadratic system for the new variables and backtrack.

Notation

Let \mathbb{F}_q denote a finite field of q elements where q is a prime power. A generic quadratic map $\mathcal{P}:(\mathbb{F}_q)^n\to\mathbb{F}_q$ can be represented by a quadratic polynomial

$$p(x_1, \dots, x_n) = \sum_{1 \le i \le j \le n} \alpha_{ij} x_i x_j + \sum_{1 \le i \le n} \beta_i x_i + \gamma$$

where $\alpha_{ij}, \beta_i, \gamma \in \mathbb{F}_q$.

Notation

• A purely quadratic map $\mathcal{F}:(\mathbb{F})^n \to \mathbb{F}$ can be written as:

$$f(x_1,\cdots,x_n)=\sum_{1\leq i\leq j\leq n}\alpha_{ij}x_ix_j$$

Notation

• A purely quadratic map $\mathcal{F}: (\mathbb{F})^n \to \mathbb{F}$ can be written as:

$$f(x_1,\cdots,x_n)=\sum_{1\leq i\leq j\leq n}\alpha_{ij}x_ix_j$$

 A useful (implementation-friendly) matrix representation is generally used:

$$\begin{bmatrix} x_1, \cdots, x_n \end{bmatrix} \begin{bmatrix} \alpha_{11} & \alpha_{12} & \cdots & \alpha_{1n} \\ 0 & \alpha_{22} & \cdots & \alpha_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ 0 & 0 & \cdots & \alpha_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ \vdots \\ x_n \end{bmatrix} = \sum_{1 \leq i \leq j \leq n} \alpha_{ij} x_i x_j$$

\mathcal{MQ} problem

• Given a system of m random quadratic equations in n variables over a finite field \mathbb{F}_q (q is a prime power) of any characteristic:

$$\begin{cases} p_1(x_1, \dots, x_n) = y_1 \\ p_2(x_1, \dots, x_n) = y_2 \\ \dots \dots \dots \dots = \dots \\ p_m(x_1, \dots, x_n) = y_m \end{cases}$$

\mathcal{MQ} problem

• Given a system of m random quadratic equations in n variables over a finite field \mathbb{F}_q (q is a prime power) of any characteristic:

$$\begin{cases} p_1(x_1, \dots, x_n) = y_1 \\ p_2(x_1, \dots, x_n) = y_2 \\ \dots \dots \dots \dots = \dots \\ p_m(x_1, \dots, x_n) = y_m \end{cases}$$

finding a solution $x \in (\mathbb{F}_q)^n$ is **NP-complete** (a reduction from the 3-SAT to the \mathcal{MQ} problem exists [Patarin and Goubin 1997]).

\mathcal{MQ} problem

• Given a system of m random quadratic equations in n variables over a finite field \mathbb{F}_q (q is a prime power) of any characteristic:

$$\begin{cases} p_1(x_1, \dots, x_n) = y_1 \\ p_2(x_1, \dots, x_n) = y_2 \\ \dots \dots \dots = \dots \\ p_m(x_1, \dots, x_n) = y_m \end{cases}$$

finding a solution $x \in (\mathbb{F}_q)^n$ is **NP-complete** (a reduction from the 3-SAT to the \mathcal{MQ} problem exists [Patarin and Goubin 1997]).

 For the average case, it is believed to be hard due to experiments although no reduction exist.

(Generic) Encryption

• Public key is the system of equations:

$$P = \{p_1(x_1, \cdots, x_n), \cdots, p_m(x_1, \cdots, x_n)\}\$$

(Generic) Encryption

• Public key is the system of equations:

$$P = \{p_1(x_1, \dots, x_n), \dots, p_m(x_1, \dots, x_n)\}\$$

ullet To encrypt a document $d_1,\cdots,d_n\in(\mathbb{F}_q)^n$, evaluate

$$(c_1,\cdots,c_m)=(p_1(d_1,\cdots,d_n),\cdots,p_m(d_1,\cdots,d_n))$$

(Generic) Encryption

• Public key is the system of equations:

$$P = \{p_1(x_1, \dots, x_n), \dots, p_m(x_1, \dots, x_n)\}$$

ullet To encrypt a document $d_1,\cdots,d_n\in(\mathbb{F}_q)^n$, evaluate

$$(c_1,\cdots,c_m)=(p_1(d_1,\cdots,d_n),\cdots,p_m(d_1,\cdots,d_n))$$

To decrypt, a trapdoor is needed to solve the system for x:

$$x_1, \cdots, x_n = P^{-1}(c_1, \cdots, c_m)$$

(Generic) Signature

• Public key is also:

$$P = \{p_1(x_1, \ldots, x_n), \cdots, p_m(x_1, \ldots, x_n)\}\$$

(Generic) Signature

• Public key is also:

$$P = \{p_1(x_1, \ldots, x_n), \cdots, p_m(x_1, \ldots, x_n)\}$$

• Private key: a trapdoor to invert P

(Generic) Signature

• Public key is also:

$$P = \{p_1(x_1, \ldots, x_n), \cdots, p_m(x_1, \ldots, x_n)\}$$

- Private key: a trapdoor to invert P
- To sign a document $D \in \{0,1\}^*$, compute the hash $h_1,\ldots,h_m:=H(D)\in (\mathbb{F}_q)^m$ solve for x to get a signature σ

$$\sigma := (x_1, \ldots, x_n) = P^{-1}(h_1, \ldots, h_m)$$

(Generic) Signature

• Public key is also:

$$P = \{p_1(x_1, \ldots, x_n), \cdots, p_m(x_1, \ldots, x_n)\}\$$

- Private key: a trapdoor to invert P
- To sign a document $D \in \{0,1\}^*$, compute the hash $h_1,\ldots,h_m:=H(D)\in (\mathbb{F}_q)^m$ solve for x to get a signature σ

$$\sigma := (x_1, \ldots, x_n) = P^{-1}(h_1, \ldots, h_m)$$

• To verify σ , recompute $\{h_1, \cdots, h_m\} \leftarrow H(D)$ and check

$$p_i(\sigma) \stackrel{?}{=} h_i, \quad 1 \leq i \leq m$$

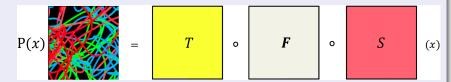

General Trapdoor construction

• Let $\mathcal{S}: \mathbb{F}_q^n o \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m o \mathbb{F}_q^m$ be two invertible linear maps

- Let $\mathcal{S}: \mathbb{F}_q^n o \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m o \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map

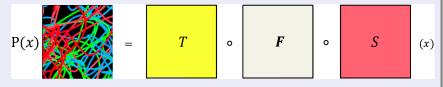

- Let $\mathcal{S}: \mathbb{F}_q^n o \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m o \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

- Let $\mathcal{S}: \mathbb{F}_q^n \to \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m \to \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

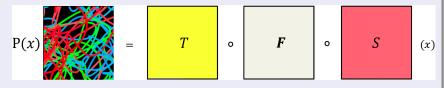

General **Trapdoor** construction

- Let $\mathcal{S}: \mathbb{F}_q^n \to \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m \to \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

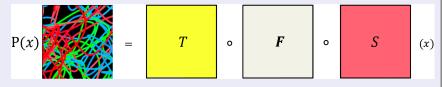

ullet ${\mathcal P}$ is random-looking and believed to be hard to invert.

- Let $\mathcal{S}: \mathbb{F}_q^n o \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m o \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

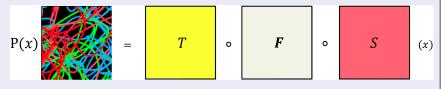

- ullet ${\cal P}$ is random-looking and believed to be hard to invert.
 - $ightharpoonup \mathcal{S}$ scrambles the variables

- Let $\mathcal{S}: \mathbb{F}_q^n o \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m o \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

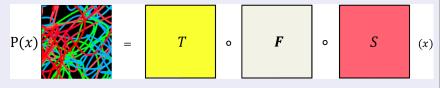

- ullet ${\cal P}$ is random-looking and believed to be hard to invert.
 - \triangleright S scrambles the variables
 - \triangleright \mathcal{F} applies m quadratic polynomials in n variables

- Let $\mathcal{S}: \mathbb{F}_q^n o \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m o \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

- ullet ${\cal P}$ is random-looking and believed to be hard to invert.
 - $\succ \mathcal{S}$ scrambles the variables
 - \triangleright \mathcal{F} applies m quadratic polynomials in n variables
 - $ightharpoonup \mathcal{T}$ mixes the polynomials

- Let $\mathcal{S}: \mathbb{F}_q^n \to \mathbb{F}_q^n$ and $\mathcal{T}: \mathbb{F}_q^m \to \mathbb{F}_q^m$ be two invertible linear maps
- ullet Let $\mathcal{F}:\mathbb{F}_q^n o\mathbb{F}_q^m$ an invertible quadratic (central) map
- ullet The public key is set to $\mathcal{P}:=\mathcal{T}\circ\mathcal{F}\circ\mathcal{S}$

- ullet ${\cal P}$ is random-looking and believed to be hard to invert.
 - $> \mathcal{S}$ scrambles the variables
 - \triangleright \mathcal{F} applies m quadratic polynomials in n variables
 - $ightharpoonup \mathcal{T}$ mixes the polynomials
- ullet Inverting ${\mathcal P}$ is related to the Isomorphism of Polynomials problem.

Isomorphism of Polynomials Problem (\mathcal{IP} -problem)

Two systems of equations/polynomials $\mathcal{U}, \mathcal{V}: \mathbb{F}_q^n \to \mathbb{F}_q^m$ are called **isomorphic** (up to linear transforms) iif \exists linear maps $\mathcal{L}_1, \mathcal{L}_2$ s.t.

$$\mathcal{U} = \mathcal{L}_1 \circ \mathcal{V} \circ \mathcal{L}_2$$

 \mathcal{IP} is not **NP-Complete** [Patarin, Goubin, and Courtois 1998]!

Isomorphism of Polynomials Problem (\mathcal{IP} -problem)

Two systems of equations/polynomials $\mathcal{U}, \mathcal{V} : \mathbb{F}_q^n \to \mathbb{F}_q^m$ are called **isomorphic** (up to linear transforms) iif \exists linear maps $\mathcal{L}_1, \mathcal{L}_2$ s.t.

$$\mathcal{U} = \mathcal{L}_1 \circ \mathcal{V} \circ \mathcal{L}_2$$

 \mathcal{IP} is not NP-Complete [Patarin, Goubin, and Courtois 1998]!

 In practice, the security of MPKC rely on a related problem that captures the concept of equivalent keys:

Isomorphism of Polynomials Problem (\mathcal{IP} -problem)

Two systems of equations/polynomials $\mathcal{U}, \mathcal{V}: \mathbb{F}_q^n \to \mathbb{F}_q^m$ are called **isomorphic** (up to linear transforms) iif \exists linear maps $\mathcal{L}_1, \mathcal{L}_2$ s.t.

$$\mathcal{U} = \mathcal{L}_1 \circ \mathcal{V} \circ \mathcal{L}_2$$

 \mathcal{IP} is not NP-Complete [Patarin, Goubin, and Courtois 1998]!

 In practice, the security of MPKC rely on a related problem that captures the concept of equivalent keys:

Extended Isomorphism of Polynomials (EIP-problem)

Given a public key $\mathcal{P} = \mathcal{T} \circ \mathcal{F} \circ \mathcal{S}$, find a map $\overline{\mathcal{F}}$ isomorphic to \mathcal{P} , i.e.,

$$\mathcal{P}=\overline{\mathcal{T}}\circ\overline{\mathcal{F}}\circ\overline{\mathcal{S}}$$

for some invertible $\overline{\mathcal{T}}$ and $\overline{\mathcal{S}}$ s.t. $\overline{\mathcal{F}}$ inherits the trapdoor structure of \mathcal{F}

Public key sizes

• Usually, public keys P consist of m quadratic polynomials of shape:

$$p_{i}(x) = [x_{1}, \dots, x_{n}] \begin{bmatrix} \alpha_{11}^{(i)} & \alpha_{12}^{(i)} & \dots & \alpha_{1n}^{(i)} \\ 0 & \alpha_{22}^{(i)} & \dots & \alpha_{2n}^{(i)} \\ \dots & \dots & \dots & \dots \\ 0 & 0 & \dots & \alpha_{nn}^{(i)} \end{bmatrix} \begin{bmatrix} x_{1} \\ \vdots \\ x_{n} \end{bmatrix}$$

Public key sizes

• Usually, public keys P consist of m quadratic polynomials of shape:

$$p_{i}(x) = [x_{1}, \dots, x_{n}] \begin{bmatrix} \alpha_{11}^{(i)} & \alpha_{12}^{(i)} & \dots & \alpha_{1n}^{(i)} \\ 0 & \alpha_{22}^{(i)} & \dots & \alpha_{2n}^{(i)} \\ \dots & \dots & \dots & \dots \\ 0 & 0 & \dots & \alpha_{nn}^{(i)} \end{bmatrix} \begin{bmatrix} x_{1} \\ \vdots \\ x_{n} \end{bmatrix}$$

• Thus, the number of elements is

$$mn(n+1)/2 \stackrel{m\approx n}{=} O(n^3)$$

Public key sizes

• Usually, public keys P consist of m quadratic polynomials of shape:

$$p_{i}(x) = [x_{1}, \dots, x_{n}] \begin{bmatrix} \alpha_{11}^{(i)} & \alpha_{12}^{(i)} & \dots & \alpha_{1n}^{(i)} \\ 0 & \alpha_{22}^{(i)} & \dots & \alpha_{2n}^{(i)} \\ \dots & \dots & \dots & \dots \\ 0 & 0 & \dots & \alpha_{nn}^{(i)} \end{bmatrix} \begin{bmatrix} x_{1} \\ \vdots \\ x_{n} \end{bmatrix}$$

• Thus, the number of elements is

$$mn(n+1)/2 \stackrel{m\approx n}{=} O(n^3)$$

- In general, for degree d polynomials, the size is $O(n^{d+1})$.
 - ightharpoonup \Rightarrow not a good idea to have high degree polynomials.
 - ▶ Stick to d = 2.

• **Direct**: try to solve the public system (invert the quadratic map).

- **Direct**: try to solve the public system (invert the quadratic map).
 - Encryption: given the ciphertext $c \in \mathbb{F}_a^m$, solve

$$\mathcal{P}(x) = c$$

for the message $x \in \mathbb{F}_q^n$.

- **Direct**: try to solve the public system (invert the quadratic map).
 - Encryption: given the ciphertext $c \in \mathbb{F}_q^m$, solve

$$\mathcal{P}(\mathsf{x}) = c$$

for the message $x \in \mathbb{F}_q^n$.

ightharpoonup Signature: given the hash $H(M)=h\in \mathbb{F}_q^m$ solve

$$\mathcal{P}(x) = h$$

for the signature $x \in \mathbb{F}_q^n$.

- **Direct**: try to solve the public system (invert the quadratic map).
 - Encryption: given the ciphertext $c \in \mathbb{F}_q^m$, solve

$$\mathcal{P}(\mathsf{x}) = c$$

for the message $x \in \mathbb{F}_q^n$.

▶ Signature: given the hash $H(M) = h \in \mathbb{F}_q^m$ solve

$$\mathcal{P}(\mathsf{x}) = h$$

for the signature $x \in \mathbb{F}_q^n$.

▶ Best time complexity is exponential when $m \approx n$

- Direct: try to solve the public system (invert the quadratic map).
 - Encryption: given the ciphertext $c \in \mathbb{F}_q^m$, solve

$$\mathcal{P}(\mathsf{x}) = c$$

for the message $x \in \mathbb{F}_q^n$.

Signature: given the hash $H(M)=h\in \mathbb{F}_q^m$ solve

$$\mathcal{P}(x) = h$$

for the signature $x \in \mathbb{F}_q^n$.

- Best time complexity is exponential when $m \approx n$
- Gröbner bases complexity f(q, m, n):

$$f(q, m, n) = O\left(m \cdot {n + d_{reg} - 1 \choose d_{reg}}^{\omega}\right)$$

where d_{reg} is degree of regularity of the system and $2 < \omega \leq 3$.

• Minrank attack: find a low rank quadratic map.

MinRank

Given a set of m matrices M_i , find a nontrivial solution $a_1, \dots a_m$ s.t.

$$\sum_{i=1}^{m} a_i M_i$$

is of minimum rank.

Finding a low rank matrix implies that we have less independent equations \Rightarrow more variables per equation can make the system easier to solve.

Encryption: Requires m > n

• To encrypt a document $d \in (\mathbb{F}_q)^n$, evaluate

$$\mathsf{c} = \mathcal{P}(\mathsf{d}) \in \mathbb{F}_q^m$$

Encryption: Requires $m \ge n$

• To encrypt a document $d \in (\mathbb{F}_q)^n$, evaluate

$$\mathsf{c} = \mathcal{P}(\mathsf{d}) \in \mathbb{F}_q^m$$

To decrypt, compute

Encryption: Requires m > n

$$\mathsf{c} = \mathcal{P}(\mathsf{d}) \in \mathbb{F}_q^m$$

- To decrypt, compute
 - $\mathsf{x} = \mathcal{T}^{-1}(\mathsf{c}) \in \mathbb{F}_q^m$

Encryption: Requires $m \ge n$

$$\mathsf{c} = \mathcal{P}(\mathsf{d}) \in \mathbb{F}_q^m$$

- To decrypt, compute
 - $\mathsf{x} = \mathcal{T}^{-1}(\mathsf{c}) \in \mathbb{F}_q^m$
 - $\mathbf{w} = \mathcal{F}^{-1}(\mathbf{x})$

Encryption: Requires $m \ge n$

$$\mathsf{c} = \mathcal{P}(\mathsf{d}) \in \mathbb{F}_q^m$$

- To decrypt, compute
 - $\mathsf{x} = \mathcal{T}^{-1}(\mathsf{c}) \in \mathbb{F}_q^m$
 - $\mathbf{w} = \mathcal{F}^{-1}(\mathbf{x})$
 - $z = S^{-1}(w)$

Encryption: Requires $m \ge n$

$$c = \mathcal{P}(d) \in \mathbb{F}_q^m$$

- To decrypt, compute
 - $\mathsf{x} = \mathcal{T}^{-1}(\mathsf{c}) \in \mathbb{F}_q^m$
 - $\mathsf{w} = \mathcal{F}^{-1}(\mathsf{x})$
 - $z = S^{-1}(w)$
- If $m \ge n$ (not undetermined) then we ensure that \mathcal{F} is more or less injective and decryption is not mapped to many different plaintexts.

• MI central map $\mathcal{F}: (\mathbb{F}_q)^n \to (\mathbb{F}_q)^n$ is defined as

$$\mathcal{F} = \phi \circ \overline{\mathcal{F}} \circ \phi^{-1}$$

• MI central map $\mathcal{F}: (\mathbb{F}_q)^n \to (\mathbb{F}_q)^n$ is defined as

$$\mathcal{F} = \phi \circ \overline{\mathcal{F}} \circ \phi^{-1}$$

where $\phi: \mathbb{F}_{q^n} \to (\mathbb{F}_q)^n$ is a coefficient-wise bijection given by

$$a_{n-1}X^{n-1} + \cdots + a_1X + a_0 \mapsto (a_{n-1}, \cdots, a_0)$$

• MI central map $\mathcal{F}: (\mathbb{F}_q)^n o (\mathbb{F}_q)^n$ is defined as

$$\mathcal{F} = \phi \circ \overline{\mathcal{F}} \circ \phi^{-1}$$

where $\phi: \mathbb{F}_{q^n} \to (\mathbb{F}_q)^n$ is a coefficient-wise bijection given by

$$a_{n-1}X^{n-1} + \cdots + a_1X + a_0 \mapsto (a_{n-1}, \cdots, a_0)$$

with $a_i \in \mathbb{F}_q$ and $\overline{\mathcal{F}}: \mathbb{F}_{q^n} o \mathbb{F}_{q^n}$ is a quadratic transform

$$\overline{\mathcal{F}}:X\mapsto X^{q^{\theta}+1}$$

ullet MI central map $\mathcal{F}: (\mathbb{F}_q)^n o (\mathbb{F}_q)^n$ is defined as

$$\mathcal{F} = \phi \circ \overline{\mathcal{F}} \circ \phi^{-1}$$

where $\phi: \mathbb{F}_{q^n} \to (\mathbb{F}_q)^n$ is a coefficient-wise bijection given by

$$a_{n-1}X^{n-1} + \cdots + a_1X + a_0 \mapsto (a_{n-1}, \cdots, a_0)$$

with $a_i \in \mathbb{F}_q$ and $\overline{\mathcal{F}}: \mathbb{F}_{q^n} o \mathbb{F}_{q^n}$ is a quadratic transform

$$\overline{\mathcal{F}}:X\mapsto X^{q^{\theta}+1}$$

• Notice that $X^{q^{\theta}+1}$ is a quadratic transformation since q^{θ} is linear $(q^{\theta}$ -Frobenius).

• MI central map $\mathcal{F}: (\mathbb{F}_q)^n o (\mathbb{F}_q)^n$ is defined as

$$\mathcal{F} = \phi \circ \overline{\mathcal{F}} \circ \phi^{-1}$$

where $\phi: \mathbb{F}_{q^n} \to (\mathbb{F}_q)^n$ is a coefficient-wise bijection given by

with $a_i \in \mathbb{F}_q$ and $\overline{\mathcal{F}}: \mathbb{F}_{q^n} o \mathbb{F}_{q^n}$ is a quadratic transform

$$\overline{\mathcal{F}}: X \mapsto X^{q^{\theta}+1}$$

- Notice that $X^{q^{\theta}+1}$ is a quadratic transformation since q^{θ} is linear $(q^{\theta}$ -Frobenius).
- The quadratic transformation takes place in the big "hidden field" \mathbb{F}_{q^n} instead of the vector space over the smaller field $(\mathbb{F}_q)^n$.

(cont. · · ·)

Encryption: The Matsumoto-Imai'88 trapdoor

Notice that for the quadratic map

$$\overline{\mathcal{F}}:X\mapsto X^{q^{\theta}+1}$$

to be invertible, ones has to take $q^{ heta}+1$ -th roots and thus $q^{ heta}+1\in\mathbb{F}_{q^n}$ must invertible

$$(X^{q^{\theta}+1})^{(q^{\theta}+1)^{-1}}=X.$$

Encryption: The Matsumoto-Imai'88 trapdoor

Notice that for the quadratic map

$$\overline{\mathcal{F}}:X\mapsto X^{q^{\theta}+1}$$

to be invertible, ones has to take $q^{ heta}+1$ -th roots and thus $q^{ heta}+1\in\mathbb{F}_{q^n}$ must invertible

$$(X^{q^{\theta}+1})^{(q^{\theta}+1)^{-1}}=X.$$

ullet The necessary condition for multiplicative inverses in $\mathbb{F}_{q^n}^*$ is

$$GCD(q^{\theta}+1,q^{n}-1)=1$$

Encryption: The Matsumoto-Imai'88 trapdoor

Notice that for the quadratic map

$$\overline{\mathcal{F}}:X\mapsto X^{q^{\theta}+1}$$

to be invertible, ones has to take $q^{ heta}+1$ -th roots and thus $q^{ heta}+1\in\mathbb{F}_{q^n}$ must invertible

$$(X^{q^{\theta}+1})^{(q^{\theta}+1)^{-1}}=X.$$

ullet The necessary condition for multiplicative inverses in $\mathbb{F}_{q^n}^*$ is

$$GCD(q^{\theta}+1,q^{n}-1)=1$$

• Thus, the quadratic map can be made invertible. The keygen, encryption and decryption for MI can be done as explained before.

Encryption: The Matsumoto-Imai'88 trapdoor

• Later, the MI encryption was shown to be insecure using linearization [Patarin 1995].

(cont. · · ·)

Encryption: The Matsumoto-Imai'88 trapdoor

- Later, the MI encryption was shown to be insecure using linearization [Patarin 1995].
- Some variants were introduced as attempts to recover security.

Encryption: The Matsumoto-Imai'88 trapdoor

- Later, the MI encryption was shown to be insecure using linearization [Patarin 1995].
- Some variants were introduced as attempts to recover security.
 - ≥ 2000, Patarin suggests **Hidden Field Equations (HFE)** encryption with a slightly modified trapdoor with $\overline{\mathcal{F}}$: $\mathbb{F}_{q^n} \to \mathbb{F}_{q^n}$ redefined to:

$$X \mapsto \sum_{0 \le i,j \le d} \mathcal{A}_{ij} X^{q^i + q^j} + \sum_k \mathcal{B}_k X^{q^k} + \gamma$$

Encryption: The Matsumoto-Imai'88 trapdoor

- Later, the MI encryption was shown to be insecure using linearization [Patarin 1995].
- Some variants were introduced as attempts to recover security.
 - ≥ 2000, Patarin suggests **Hidden Field Equations (HFE)** encryption with a slightly modified trapdoor with $\overline{\mathcal{F}}$: $\mathbb{F}_{q^n} \to \mathbb{F}_{q^n}$ redefined to:

$$X \mapsto \sum_{0 \le i,j \le d} \mathcal{A}_{ij} X^{q^i + q^j} + \sum_k \mathcal{B}_k X^{q^k} + \gamma$$

Later, Kipnis and Shamir 1999 showed that degree *d* cannot be too small otherwise minrank + linearization attacks apply.

Encryption: The Matsumoto-Imai'88 **trapdoor**

- Later, the MI encryption was shown to be insecure using linearization [Patarin 1995].
- Some variants were introduced as attempts to recover security.

Summary of UOV

- UOV was proposed in 1999 and has not suffured major attacks.
- Faster than ECDSA signature. $2-4\times$ faster to sign, $10-20\times$ faster for verifying.
- Signature sizes are less than 1KiB
- Public keys are large: tens or hundreds KiB
 - Potential topic for research!

Rainbow signature

- Proposed by Ding and Schmidt 2005.
- It is a generalization of UOV (w/ faster and shorter signatures)
- Idea: split private quadratic maps into layers.
 - Solve more but smaller systems of equations.
 - Vinegars for the next layer will be the the vinegars + oils from the previous one.

Rainbow signature

• Assume integer chain $0 < v_1 < \cdots < v_u < v_{u+1} = n$

Rainbow signature

- Assume integer chain $0 < v_1 < \cdots < v_u < v_{u+1} = n$
- Let $V_i := \{1, \dots, v_i\}$ and $O_i := \{v_i + 1, \dots, v_{i+1}\}$, be sets and $o_i := v_{i+1} v_i$ the numbers of oils.

Rainbow signature

- Assume integer chain $0 < v_1 < \cdots < v_u < v_{u+1} = n$
- Let $V_i := \{1, \dots, v_i\}$ and $O_i := \{v_i + 1, \dots, v_{i+1}\}$, be sets and $o_i := v_{i+1} v_i$ the numbers of oils.
- Central map $\mathcal F$ consists of $m=n-v_1$ polynomials $f^{(v_1+1)}, \, \cdots, \, f^{(n)}$

$$f^{(k)} = \sum_{i,j \in V_{\ell}} \alpha_{ij}^{(k)} x_i x_j + \sum_{i \in V_{\ell}, j \in O_{\ell}} + \beta_{ij}^{(k)} x_i x_j + \sum_{i \in V_{\ell} \cup O_{\ell}} \gamma_i^{(k)} x_i$$

where ℓ is the only integer s.t. $k \in O_{\ell}$.

Rainbow signature

- Assume integer chain $0 < v_1 < \cdots < v_u < v_{u+1} = n$
- Let $V_i := \{1, \dots, v_i\}$ and $O_i := \{v_i + 1, \dots, v_{i+1}\}$, be sets and $o_i := v_{i+1} v_i$ the numbers of oils.
- Central map $\mathcal F$ consists of $m=n-v_1$ polynomials $f^{(v_1+1)}, \, \cdots, \, f^{(n)}$

$$f^{(k)} = \sum_{i,j \in V_{\ell}} \alpha_{ij}^{(k)} x_i x_j + \sum_{i \in V_{\ell}, j \in O_{\ell}} + \beta_{ij}^{(k)} x_i x_j + \sum_{i \in V_{\ell} \cup O_{\ell}} \gamma_i^{(k)} x_i$$

where ℓ is the only integer s.t. $k \in O_{\ell}$.

ullet Choose invertible linear maps $\mathcal{T}:\mathbb{F}_q^m o\mathbb{F}_q^m$ and $\mathcal{S}:\mathbb{F}_q^n o\mathbb{F}_q^n$

Rainbow signature

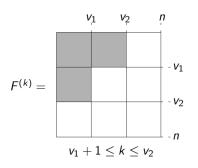

- Assume integer chain $0 < v_1 < \cdots < v_u < v_{u+1} = n$
- Let $V_i := \{1, \dots, v_i\}$ and $O_i := \{v_i + 1, \dots, v_{i+1}\}$, be sets and $o_i := v_{i+1} v_i$ the numbers of oils.
- ullet Central map ${\mathcal F}$ consists of $m=n-v_1$ polynomials $f^{(v_1+1)},\, \cdots,\, f^{(n)}$

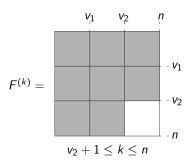

$$f^{(k)} = \sum_{i,j \in V_{\ell}} \alpha_{ij}^{(k)} x_i x_j + \sum_{i \in V_{\ell}, j \in O_{\ell}} + \beta_{ij}^{(k)} x_i x_j + \sum_{i \in V_{\ell} \cup O_{\ell}} \gamma_i^{(k)} x_i$$

where ℓ is the only integer s.t. $k \in O_{\ell}$.

- ullet Choose invertible linear maps $\mathcal{T}:\mathbb{F}_q^m o\mathbb{F}_q^m$ and $\mathcal{S}:\mathbb{F}_q^n o\mathbb{F}_q^n$
- Public key is $\mathcal{P} = \mathcal{T} \circ \mathcal{F} \circ \mathcal{S}$.

Rainbow central map with 2 layers

• $x_1, \dots, x_{v_1}, x_{v_1+1}, \dots, x_{v_1+o_1}$ will be the vinegars x_1, \dots, x_{v_2} for the second layer.

Rainbow (2 layers): Toy example [from A. Petzoldt, 2017]

- \mathbb{F}_7 , $(v_1, o_1, o_2) = (2, 2, 2)$, $m = n v_1 = 4$
- Central map $\mathcal{F} = (f^{(3)}, f^{(4)}, f^{(5)}, f^{(6)})$ with

$$f^{(3)} = x_1^2 + 3x_1x_2 + 5x_1x_3 + 6x_1x_4 + 2x_2^2 + 6x_2x_3 + 4x_2x_4 + 2x_2 + 6x_3 + 2x_4 + 5$$

$$f^{(4)} = 2x_1^2 + x_1x_2 + x_1x_3 + 3x_1x_4 + 4x_1 + x_2^2 + x_2x_3 + 4x_2x_4 + 6x_2 + x_4$$

$$f^{(5)} = 2x_1^2 + 3x_1x_2 + 3x_1x_3 + 3x_1x_4 + x_1x_5 + 3x_1x_6 + 6x_1 + 4x_2^2 + x_2x_3 + 4x_2x_4 + x_2x_5 + 3x_2x_6 + 3x_2 + 3x_3x_4 + x_3x_5 + 2x_3x_6 + 2x_3 + 3x_4x_5 + x_5 + 6x_6$$

$$f^{(6)} = 2x_1^2 + 5x_1x_2 + x_1x_3 + 5x_1x_4 + 5x_1x_6 + 6x_1 + 5x_2^2 + 3x_2x_3 + 5x_2x_5 + 4x_2x_6 + x_2 + 3x_3^2 + 5x_3x_4 + 4x_3x_5 + 2x_3x_6 + 4x_3 + x_4^2 + 6x_4x_5 + 3x_4x_6 + 4x_4 + 4x_5 + x_6 + 2$$

• Goal: Compute the preimage $x \in \mathbb{F}_7^6$ for y = (6, 2, 0, 5) under \mathcal{F} .

Rainbow: Toy example [from A. Petzoldt, 2017] (cont. ...)

• Choose random values for the Vinegar variables x_1 and x_2 , e.g. $(x_1, x_2) = (0, 1)$ and substitute them into the polynomials $f^{(3)}, \ldots, f^{(6)}$.

$$\tilde{f}^{(3)} = 5x_3 + 6x_4 + 2, \tilde{f}^{(4)} = x_3 + 5x_4,
\tilde{f}^{(5)} = 3x_3x_4 + x_3x_5 + 2x_3x_6 + 3x_3 + 3x_4x_5 + 4x_4 + 2x_5 + 2x_6,
\tilde{f}^{(6)} = 3x_3^2 + 5x_3x_4 + 4x_3x_5 + 2x_3x_6 + x_4^2 + 6x_4x_5 + 3x_4x_6 + 4x_4 + 2x_5 + 5x_6 + 1.$$

- Set $\tilde{f}^{(3)} = y_1 = 6$ and $\tilde{f}^{(4)} = y_2 = 2$ and solve for $x_3, x_4 \Rightarrow (x_3, x_4) = (3, 4)$
- Substitute into $\tilde{f}^{(5)}$ and $\tilde{f}^{(6)}$ $\Rightarrow \tilde{\tilde{f}}^{(5)} = 3x_5 + x_6 + 5, \tilde{\tilde{f}}^{(6)} = 3x_5 + 2x_6 + 1$
- Set $\tilde{f}^{(5)} = y_3 = 0$ and $\tilde{f}^{(6)} = y_4 = 5$, solve for x_5 and $x_6 \Rightarrow (x_5, x_6) = (0, 2)$

A pre image of $\mathbf{y} = (6, 2, 0, 5)$ is given by $\mathbf{x} = (0, 1, 3, 4, 0, 2)$.
